

What is EDSWT?

EDSWT - designed especially for treating Erectile Dysfunction - is based on the use of low intensity extracorporeal shock waves, which have been used successfully since 2005 in the treatment of ischemic tissues in the heart, improving the volume of blood flow into the tissue. The shock waves are reflected by the machine and are focused onto the treatment area, creating new blood vessels in penile tissue, which then enables the patient to achieve and maintain firm erections.

How is Shockwave Therapy Different from Other ED Treatments?

Shock wave therapy is a non-invasive, non-pharmacological procedure that triggers a natural mechanism that actually fixes vascular-related ED problems, rather than just treating the symptoms. Unlike other therapies that utilize drugs such as Viagra, Cialis, or Levitra - or employ vacuum pumps, injections or implants - EDSWT has no detrimental effect on any systems or organs of the body.

Medispec's cutting-edge solution is bringing long-lasting improvement in erectile function to men around the world - painlessly, naturally, and safely.

MEDISPEC

Feel Like You Are 21 Again

Drug-Free Solution for Erectile Dysfunction

- ✓ Long Term Solution
- ✓ Pain Free Treatment
- ✓ Effective for men who do not respond to pharmaceuticals

OR-5-X510 A02

Take Control Over Your Sex Life

TREAT THE CAUSE AND NOT THE SYMPTOMS

New Effectiveness for More Patients

With over 50% of men suffering from Erectile Dysfunction, the ED1000 is the most effective solution on the market. This breakthrough, therapeutic treatment, brings long lasting improvement for erectile function and sexual health to millions of men - without pain or medication.

Leveraging **advanced cardiology solution** in utilizing shockwave therapies, the **ED-1000** is the only existing method for actually curing Erectile Dysfunction - not just masking the underlying problem.

For the first time, your doctor can now provide you with a clinically-proven treatment that is **easy, safe, fast, and painless** - delivering a full solution for vascular-related ED problems.

Using **pain free**, low-intensity acoustic shock waves, similar to ultrasound waves, the EDSWT treatment stimulates the creation of new microvascular blood vessel networks that increase the blood supply to erectile tissue, thus enabling the achievement and maintenance of full, dependable erections.

Feel Like You are 21 Again

- **Significant improvement in sexual performance**
- **Tiggers the body's natural repair mechanism**
- **Enables natural erection mechanism**
- **Long term solution**

Is the Treatment Effective?

Yes, the treatment works for almost everyone whose ED problems are vascular-related - around 70% of those with ED. Extensive clinical trials have shown significant improvement in erectile function for at least a year following treatment. The therapy even enables patients with severe ED - for whom medications have had no effect, and whose only choices were vacuum pumps, injections, and implants - to become responsive to PDE5 Inhibitor treatments.

Is Shockwave Treatment Better than Pharmacological Alternatives such as PDE5 Inhibitors?

Yes. There is a growing realization among medical specialists that pharmacotherapy is not sufficient, especially in such delicate and complex matters as male sexuality. Issues such as adverse events and contraindication to PDE5i in men who suffer from heart diseases as well as lack of spontaneity and medication dependency lead to 50% drop out from pills solution.

Pills, Pumps & Injections

Is it Safe? Are There Side-Effects?

Yes, the treatment is completely safe. It is non-invasive and no medications are used.

There are no reported side-effects during, immediately following, or post-treatment. Patients are able to return to their daily routines immediately following each treatment session.

Is it Painful? Are Sedation or Pre-Treatment Procedures Required? What does it Feels Like?

No, the treatment is not painful, and no sedation or preparatory procedures are required. Some patients have reported a slight tingling sensation during the treatment that disappears as soon as the treatment session ends.

Where is the Treatment Performed? Is it Done Discreetly? Is Hospitalization Required?

Typically, the treatments are performed in doctors' clinics, which, by their nature, are discreet. They are conducted in a private room, with only the therapist present.

How long does it take?

Each session takes approximately 20 minutes. The entire treatment protocol consists of several sessions, which are conducted over few weeks time.

How Soon can Improvement be Noticed? How Long will it Last?

Patients report discernible improvement within 2 weeks of beginning the treatment, with a high rate or satisfaction for more than a year following treatment - without reliance on PDE5 Inhibitors.

Will Treatments Need to be Repeated in the Future?

Generally, following the initial series of treatments, no additional treatments are required. However, the treatment can be repeated as often as necessary, since it is non-invasive, painless, and there are no side-effects.
